

Seal Systems Ireland have received NSAI Irish Agreement Certification for **Elastocoat [R] C 6335 /101** the BASF Polyurethanes polyurea exclusively supplied to the Irish Market by them.

A 3 year programme of meticulous, consistent attention to the details and testing required by the Irish Agreement Board has culminated in the only Agreement certification achieved for a sprayable polyurea in these applications.

The vital aspect of understanding that stringent attention to compliance in regard to on site quality control of this superior seamless option for waterproofing multiple concrete structures including Roofs, Podiums, Basements and Bridge decks, was the driving force behind the crucial decision to embark upon IAB certification. This achievement will now satisfy completely the concerns of specifiers in this sector, giving them peace of mind in relation to proper application procedures that will ensure the life expectancy of **Elastocoat [R] C 6335/101** waterproofing membrane. Evident throughout the construction industry is failure due to lack of control on site of applications for various roof membrane options coupled with a dependence upon variously formed joints. Also the unrivalled life expectancy of 25 years + shown within this Irish Agreement Cert for these applications with **Elastocoat [R] C 6335/101** is another seriously distinct advantage which again specifiers will be very comfortable with.

It is fascinating that many of the applicators giving guarantees for different options of products for waterproofing concrete structures, have no credible record in business which gravely negates the guarantees they give, This is why realistic commercial decisions must be made in terms of feasibility in accepting such guarantees for long periods where it is highly unlikely that their will be an accountable entity surviving to take responsibility for problems that may occur in the future. This is another issue that Seal Systems Ireland have addressed in their philosophy of only dealing with established, credible applicators who comply with Irish company law. These conditions are real assurance going forward instead of useless documents filed away that are soon invalid and riddled with loopholes, This escape from clear responsibility, also relates to many Insurance policies and multiple agency collateral warranties. The ultimate situation is to ensure long term life expectancy of the product applied, by strictly monitored quality control procedures patrolled by an independent body Like IAB in our case, This approach with top quality polyurea like **Elastocoat [R] C 6335/101** is the supreme option to ensure long life integrity, and the greatest insurance of a guarantee available, for waterproofing concrete structures. Achieving such high standards required for Irish Agreement certification is an accomplishment that will completely change the approach to waterproofing multiple kinds of concrete structures for many years to come. Discerning Specifiers, Designers, Building Contractors, will embrace this concept in the interest of sustainable performance coupled with realistic long term financial savings. The large investment made by Seal Systems Ireland in getting to completion of this Irish Agreement Certification can be clearly seen as a sound investment for the future.
